It's taken a lot longer than expected, but the Zuka theme can now be downloaded from the 🔗 file gallery at themes.tw.o. No registration or log-in is needed to download the files. (Update 2: Zuka_v1.1 is now available. It has better IE7 compatibility and includes the earlier fixes and updates.)

Zuka uses a source-ordered, no-tables, liquid layout based on 🔗's 🔗 layout, similar to what is used by the simple.css Tiki theme.

The theme archive includes information about installation and customizing. Also see 🔗. The InterTiki user authorization system has been working off and on. If there are any questions or problems to report about Zuka installation and use, and if it isn't possible to log in here, please use the tw.o 🔗. The theme is released under the LGPL license and will soon be committed to Tiki CVS.

Zuka started as the default theme at 🔗, as a simple monochrome theme with an oldschool table layout. In keeping with the style, the theme uses its own set of black-and-white icons for some Tiki features.

Not only have more tables been converted to unordered lists, but some that displayed icons or text links, such as for edit, print, and pdf, have been given the 🔗 menu treatment. This type of CSS-powered menu can also be used in the wikitext, for *toc* or other link lists.

Originally, the theme put all left- and right-column modules on the left side of the page, but now right-column modules are also an option as with other Tiki themes, for maximum flexibility.

Zuka is compatable with all PHP Layers menu configurations, but installation doesn't expect any particular menu to already be set up.

The theme includes a print stylesheet for wiki pages, articles and blog posts.
