This is an adaptation for Tiki CMS of [\[link\]](#)'s freely released Andreas09 design. The theme uses luci's [\[link\]](#) layout method and so is source-ordered and table-free. Going beyond the great design of the original, this adaptation has a center content column that widens to accomodate large images, tables, etc. As with all Tiki themes, one-, two-, and three-column layouts are possible.

The page background and menu hover images can be easily changed. Alternative images are included.

After delays getting things to work properly with Internet Explorer 7, the theme files are finally finished and can be downloaded [\[link\]](#). Please report any problems in the themes.tikiwiki.org forum.

Andreas09 has CSS support for both vertical and horizontal PHP Layers menus. The horizontal menu can be used in the navigation bar area, or conventional HTML links can be used there. Edit the theme's tiki.tpl file to specify the menu, etc.

Tiki's Site Identity feature is supported. The Site Identity content is placed within the colored area at the top of the page, and can be text or logo image, along with a banner zone, etc., as configured on the Admin Site Identity page.

The theme files include module templates in which tables have been replaced with divs and spans, consistent with the template approach in this and some other new themes.

See [\[link\]](#) for more information, and enjoy!
